

Solution Requirements

Date	15 March 2026
Team ID	SWTID-2026-1309
Project Name	Pocket Smart AI
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category		
1	Authentication	Users securely log in using their registered email/mobile and password, with OTP verification for account recovery.	High
2	Authorization levels	Users manage only their own profile, transactions, budgets and financial data; an admin role can manage users and system settings.	High
3	External interfaces	Connects to an AI service/API for transaction categorization and financial insights, and a database for user, transaction and budget data.	High

		External AI service/API and database services are required for AI-based analysis and persistent financial data storage.	
4	Transactions processing	Income and expense entries are validated, categorized and stored; balances and budgets are updated after each transaction.	High
5	Reporting	Provides a dashboard with income, expenses, category-wise spending, budget status and financial trend reports.	Medium
6	Business rules, etc.	Income increases available balance, expenses reduce it, and budget alerts are triggered when configured spending limits are reached.	High
7	Compliance to laws or regulations	Protects personal and financial data through controlled access, secure storage and privacy practices applicable to the solution.	High
8	Other	Provides AI-generated spending insights, budget suggestions and reminders based on the user's recorded financial activity.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria

1	Performance & Speed	Pages and dashboards should load quickly; common user actions should respond without noticeable delay.	Page load <= 2 seconds; AI insight <= 5 seconds
2	Scalability	System should support increasing users and financial records without major performance degradation.	Supports at least 1,000 active users and scalable transaction storage
3	Security & Data Privacy	User financial data must be protected with authentication, access control and encrypted data transmission/storage.	HTTPS/TLS in transit; encrypted sensitive data at rest
4	Reliability & Availability	System should remain available and handle temporary service failures without data loss.	Target 99.5% monthly availability; failed writes must not corrupt data
5	Usability & Accessibility	Interface should be simple, readable and usable on common desktop and mobile screen sizes.	Responsive UI; core tasks completable with clear labels and navigation
6	Other	Code and components should be modular so features can be maintained and deployed across supported environments.	Maintainable modular code; deployable on the supported application environment
